Remote diagnosis by intelligent cameras

INSENSIV is specialized in intelligent vision systems for agricultural applications. Various products were awarded with the Gold Medal of the EuroTier and the Agritechnica. Each OEM product is adapted to the customers needs.

INSENSIV cameras are in the line of duty where processes have to be observed from a distance. The pictures of the camera can be retrieved by any web browser with all Internet capable devices (Smartphones, Notebook, PCs). Different applications can for example be:

- Surveillance of animals – especially those animals who need more attention (illness, injury, pregnancy, young animals, ...)
- Surveillance of access (optional with movement detection)
- Fill level identification
- Reversing camera, „driving mirror“ or parking assistance for agricultural vehicles

In addition to the image acquisition the intelligent cameras with integrated micro-processor offer the opportunity to screen information and to react independently on events. Using the camera for example an automatic motion detection can be performed.

The cameras can operate non-wireless in the local area network (LAN) or wireless via WLAN. Another method is to put the pictures of the camera coded on the Internet which provides a transportable access with UMTS-enabled Smartphones or Notebooks.
